

DRY LAND JUNCEA - 2010

Do you want a tough Brassica break crop that is:

- Suited to low rainfall cropping areas
- Drought tolerant and cost effective
- Improved survival in higher temperatures, and variable rainfall conditions
- Lower risk crop for farmers than traditional canola in the low rainfall zone

BioMax DLJ200 has been bred by SARDI and selected as a short season, early flowering crop. This crop is suited to cropping areas in the less than 375mm total rainfall zone, and the oil is well suited for production of BioMax Biodiesel

- Rotational benefits include bio-fumigation and control of cereal crop diseases with enhanced resistance to Blackleg fungus
- Less prone to shattering than traditional canola

Growing agreements – area based, agreed price, and no washout

- To register now for the 2010 cropping season please contact Smorgon Fuels
 - Tel 03 8360 0600
